One Step Setup

- In the menu bar, choose [**Tools -> TechTweaking -> Bluetooth Classic -> Setup the BT library**] and you are ready.

This library used to have a prefab called BtConnector that needed to be in the scene. This is no longer needed.

Combining Multiple Android Plugins

Basically, this library had to be the last one to be installed. After you done the setup process of all your different plugins, do this:

- In the menu bar, Go to [**Tools->TechTweaking->Bluetooth Classic->Setup the BT library**]. This will add the required permissions (if needed) to any AndroidManifest.xml that exists in the 'Assets/Plugins/Android' folder. Also it will add a *.jar file to the same folder.

If you already had this library working, and want to add another plugin. **Just delete the Android folder 'Assets/Plugins/Android'**, then make your other plugins ready, then perform the above step [**Tools->TechTweaking->Bluetooth Classic->Setup the BT library**].

Additional Information:

This plugin only require three permissions:

```
<uses-permission android:name="android.permission.ACCESS_COARSE_LOCATION" />
<uses-permission android:name="android.permission.BLUETOOTH" />
<uses-permission android:name="android.permission.BLUETOOTH_ADMIN" />
```

[**Tools -> TechTweaking -> Bluetooth Classic -> Setup the BT library**] will add those permissions (<user-permission> nodes) just above the <application> tag.

Note: You can change the BT_Library_Bluetooth_Classic.jar name.
